**Comparison of teen aggression level  
based on parenting styles and parent-child  
attachment styles**

**Abstract**

**Introduction:** aggression is a common abnormal behavior among adolescents and is considered as an important issue in psychology and sociology . Family and parenting style have important impact on aggressive behavior in adolescents and children.

**Objective:** The objective of this study was to compare the amount and type of adolescent aggression based on parenting style and parental attachment as well.

**Methods:** In this cross-sectional study ,131 adolescents with age between 13 to 14 from schools all over Tehran were selected by random cluster sampling method and classified in two normal and abnormal groups ( aggressive) by the school authority report and also aggression Arnold.H.buss questionnaire as well as attachment Hazan & Shaver and parenting Diana Bamrind questionnaires.

**Results:** there were a statistically significant correlation between parenting style as well as attachment style with aggression and aggression type (respectively, P value < 0/001, P value = 0/001). ANOVA test showed a statistically significant correlation between aggression score with parental style groups as well.

**Conclusion:** This study further supports significant correlation between aggression and type of that and parent -child attachment and parenting styles.

**Keywords:** aggression, adolescents, parenting style, attachment style
